Lab Program 1:

Develop a Java program that prints all real solutions to the quadratic equation ax2 +bx+c = 0. Read in a, b, c and use the quadratic formula. If the discriminate b2-4ac is negative, display a message stating that there are no real solutions.

```
import java.util.Scanner;
public class Quadratic
{
 public static void main(String args[])
 {
   double a,b,c;
   double root1,root2;
   Scanner in=new Scanner(System.in);
   System.out.println("Enter value of a : ");
   a=in.nextDouble();
   System.out.println("Enter value of b : ");
   b=in.nextDouble();
   System.out.println("Enter value of c : ");
   c=in.nextDouble();
   double determinant=(b*b)-(4*a*c);
   double sq=Math.sqrt(determinant);
   // condition for real and different roots
   if(determinant>0)
   {
    root1=((-b+sq)/(2*a));
    root2=(-b-sq)/(2*a);
    System.out.println("Root 1= "+root1+"\t"+"Root2= "+root2);
   }
   // condition for real and equal roots
   else if(determinant==0)
   {
    root1=root2=(-b+sq)/(2*a);
    System.out.println("Root 1=Root 2=  "+root1);
   }
   // condition for roots that are not real
   else
   {
    double  real=-b/(2*a);
    double  img=Math.sqrt(-determinant)/(2*a);
    System.out.println("Root 1= "+real+"+"+img+"i"+"\t"+"Root2= "+real+"-"+img+"i");
   }
  }
}
```

OUTPUT:

```

LAB PROGRAM-2

Sneha Srivastava (1BM19CS158)

ALGORITHM:-

STEP:1:- START.

STEP:2:- import java.util.* package created along with class Student.

STEP:3:- Required variables & array created.

STEP:4:- void read_data() method created to read name, USN & Credits & marks of the student.

STEP:5:- void calc_SGPA() method created so as to calculate the SGPA of 5 subjects according to the marks and grade points of every subject.

STEP:6:- SGPA after calculation is printed.

STEP:7:- Creation of void details() method to display all the requirements on the screen i.e. Name, USN, MARKS, Credits & SGPA of a student.

STEP:8:- Now, main method() is created and an object ob is created.

STEP:9:- The object ob calls all the three methods i.e. ob.read_data(), ob.calc_SGPA(), ob.details() and performs the requirements.

STEP:10:- Close of main() method along with the close of class Student.

STEP:11:- STOP.

ALGORITHM

Step 1:- Start.
Step 2:- import java.util.* package & create class Book1.
Step 3:- Required variables i.e. name, author, price & num-pages is declared.
Step 4:- Constructor Book1() created to initial the values to the variables.
Step 5:- method DETAILS() is created in order to enter the details of the book, i.e. name of the book, author, price & no. of pages.
Step 6:- Another method ToString() is created.
Step 7:- The method ToString() basically prints all the details of the book.
Step 8:- Now, main() method is created.
Step 9:- An object is created obj to call the functions.
Step 10:- Scanner object ob1 is also created in order to create n book objects.
Step 11:- A for loop is created for n book objects which calls the methods DETAILS() & ToString().
Step 12:- The main method() is closed along with the close of Class Book1.
Step 13:- Stop.

Lab Program 4:

Develop a Java program to create an abstract class named Shape that contains two integers and an empty method named printArea( ). Provide three classes named Rectangle, Triangle and Circle such that each one of the classes extends the class Shape. Each one of the classes contain only the method printArea( ) that prints the area of the given shape.

```
import java.util.*;
import java.lang.Math.*;

abstract class shape{
	public int a;
	public int b;
	abstract public void printArea();
	Scanner s=new Scanner(System.in);
}

class rectangle extends shape{
	public void printArea(){
		System.out.print("Enter length and breadth of rectangle: ");
		float a=s.nextFloat();
		float b=s.nextFloat();
		float area=a*b;
		System.out.println("Area="+area+"sq.units");
	}
}

class triangle extends shape{
	public void printArea(){
		System.out.print("Enter three sides of triangle: ");
		float a=s.nextFloat();
		float b=s.nextFloat();
		float c=s.nextFloat();
		float d=(a+b+c)/2;
		double area=Math.sqrt(d*(d-a)*(d-b)*(d-c));
		System.out.println("Area="+area+"sq.units");
	}
}

class circle extends shape{
	public void printArea(){
		System.out.print("Enter radius of circle: ");
		float a=s.nextFloat();
		float area=22/7*a*a;
		System.out.println("Area="+area+"sq.units");
	}
}

class shapedemo{
	public static void main(String args[]){
		shape r=new rectangle();
		shape t=new triangle();
		shape c=new circle();
```

```
            for(int i=0;i<100;i++){
            System.out.println("\n1)Triangle\n2)Rectangle\n3)Circle\n");
            System.out.println("Enter your choice: ");
            Scanner s=new Scanner(System.in);
            int ch=s.nextInt();
            switch(ch){
                  case 1: t.printArea();
                        break;
                  case 2: r.printArea();

Enter length and breadth of rectangle: 5
8
Area = 40.0 sq.units
1) Triangle
2) Rectangle
3) Circle
Enter your choice:
9
Invalid choice

Lab Program 5:

Develop a Java program to create a class Bank that maintains two kinds of account for its customers, one called savings account and the other current account. The savings account provides compound interest and withdrawal facilities but no cheque book facility. The current account provides cheque book facility but no interest. Current account holders should also maintain a minimum balance and if the balance falls below this level, a service charge is imposed. Create a class Account that stores customer name, account number and type of account. From this derive the classes Curr-acct and Sav-acct to make them more specific to their requirements. Include the necessary methods in order to achieve the following tasks:

- **Accept deposit from customer and update the balance.**
- **Display the balance.**
- **Compute and deposit interest**
- **Permit withdrawal and update the balance**
- **Check for the minimum balance, impose penalty if necessary and update the balance.**

```
import java.util.*;
class Account
{

Lab Program 6:

Create a package CIE which has two classes- Student and Internals. The class Personal has members like usn, name, sem. The class Internals has an array that stores the internal marks scored in five courses of the current semester of the student. Create another package SEE which has the class External which is a derived class of Student. This class has an array that stores the SEE marks scored in five courses of the current semester of the student. Import the two packages in a file that declares the final marks of n students in all five courses.

```
package CIE;
import java.util.*;
public class personal
{
  public String name;
  public int sem;
  public String usn;

  public void read()
  {
    Scanner sc = new Scanner(System.in);
    System.out.println("Enter the name");
    name = sc.next();
    System.out.println("Enter the semester");
    sem = sc.nextInt();
    System.out.println("Enter the USN");
    usn = sc.next();
  }
  public void display()
  {
    System.out.println("Student details: ");
    System.out.println("Name: "+name+"\nUSN: "+usn+"\nSem: "+sem);
  }
}

Lab Program 8:

Write a program that demonstrates handling of exceptions in inheritance tree. Create a base class called "Father" and derived class called "Son" which extends the base class. In Father class, implement a constructor which takes the age and throws the exception WrongAge( ) when the input age<0. In Son class, implement a constructor that cases both father and son's age and throws an exception if son's age is >=father's age.

```
import java.util.*;
class WrongAge extends Exception{
 int f,s;
WrongAge(int fage,int sage){
f=fage;
s=sage;
}
public String toString(){
return "Please enter the correct ages as father's age can't be less than or equal to the son's
age.";
}}
class NegativeAge extends Exception{
int x;
NegativeAge(int fage){
x=fage;
}
public String toString(){
return "Age can't be a negative value.";
}}
class Father
{
int fage;
Scanner in=new Scanner(System.in);
Father() throws NegativeAge
{
System.out.println("Enter the father's age:");
fage=in.nextInt();
if(fage<0){
throw new NegativeAge(fage);
}}}
class Son extends Father
{
int sage;
Scanner in=new Scanner(System.in);
Son() throws NegativeAge,WrongAge{
super();
System.out.println("Enter the son's age :");
sage=in.nextInt();
if(sage<0)

  }).
```

Lab Program 9:

Write a program which creates two threads, one thread displaying "BMS College of Engineering" once every ten seconds and another displaying "CSE" once every two seconds.

```
class thread1 implements Runnable
{
    Thread t;
    thread1()
    {
        t = new Thread(this,"thread1");
        t.start();
    }

    public void run()
    {
   for(;;)
  {
         try
         {
            System.out.println("BMS College Of Engineering");
            Thread.sleep(10000);
         }
        catch(InterruptedException ie)
        {
            System.out.println("Interrupted");
        }
    }
  }
}

class thread2 implements Runnable
{
    Thread t2;
    thread2()
    {
        t2 = new Thread(this,"thread2");
        t2.start();

    }

    public void run()
    {   for(;;)
  {
         try
         {
            System.out.println("CSE");
            Thread.sleep(2000);
         }
        catch(InterruptedException ie)
        {
            System.out.println("Interrupted");
        }
    }
  }
}
```

```
class threadmain
{
   public static void main(String args[])
   {
      System.out.println("Enter CONTROL+C to stop");
       thread1 t1 = new thread1();
       thread2 t2 = new thread2();

   }
}
```

Lab Program 10:

Write a program that creates a user interface to perform integer divisions. The user enters two numbers in the text fields, Num1 and Num2. The division of Num1 and Num2 is displayed in the Result field when the Divide button is clicked. If Num1 or Num2 were not an integer, the program would throw a NumberFormatException. If Num2 were Zero, the program would throw an Arithmetic Exception Display the exception in a message dialog box.

```
import javax.swing.*;
import java.awt.*;
import java.awt.event.*;

class SwingDemo{
   SwingDemo(){
      // create jframe container
      JFrame jfrm = new JFrame("Divider App");
      jfrm.setSize(275, 150);
      jfrm.setLayout(new FlowLayout());
      // to terminate on close
      jfrm.setDefaultCloseOperation(JFrame.EXIT_ON_CLOSE);

      // text label
      JLabel jlab = new JLabel("Enter the divider and divident:");

      // add text field for both numbers
      JTextField ajtf = new JTextField(8);
      JTextField bjtf = new JTextField(8);

      // calc button
      JButton button = new JButton("Calculate");

      // labels
      JLabel err = new JLabel();
      JLabel alab = new JLabel();
      JLabel blab = new JLabel();
      JLabel anslab = new JLabel();
